FEATURES

CDS

gene

```
regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

셤 8

```
This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by at least one plasmid subclone or more than one subclone.
                                                                                                                                                                                                                                                                                                                                                                             Sequence Quality Assessment:
This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero. Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /uganism=-mondach DNA"

HSDJ137K2 18-MAY-2005
Human DNA sequence from clone RP1-137K2 on chromosome 6q25.1-25.3
Contains part of the gene for BRG1-binding protein BLD/OSA1 (p250R KTAA1235) (FLJ00253 FLJ22292), a novel gene and two CpG islands, AL049820
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bukaryota; Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contigl has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8% average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         **NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

**This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

Center clone name: RP11-668D4 (bc0770)	ansus quality: Jostes at least Q20 tt size: 20462; sum-of-contigs tty coverage: 8.2x in Q20 bases; sum-of-contigs 	requence Quality Assessment: This entry has been annotated with sequence quality setimates computed by the Phrap assembly program. All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp. Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN 1 file.	This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., Phred quality, >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest.	e Complete tally derivable derivable for both complete on the	SeqDerMap FngrPrnt SeqDerMap FngrPrnt 21681 22111 8696 8802 1823 1842 6 6800 2912 2880 5030 5004 463 <800 5757 5717 2349 2347 12366 12038 5483 5381 14141 13920 5483 6800 8270 8215 21 <800 4241 4265 216 <800 4300 4265 216 <800 4300 4265

                                                                                                                                                                                                                                              NOTE: Bstimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 25 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (1.e., phred quality >=
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                repeat_region
                                                                                            Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu
30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                       SOURCE INFORMATION:

The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa and Minako Tateno in the laboratory of Pieter de Jong (http://www.chori.org) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Genetics, Inc. (http://www.resgen.com) or pieter de Jong and coworkers at http://www.corpi.org
                                                                                                                                                                                                                                                                                                 NEIGHBORING SEQUENCE INFORMATION:
This sequence is the entire insert of the clone. This clone is overlapped by AL928713 and AL929149.

New isolated cancer associated nucleic acids comprising at least 10 contiguous nucleotides, useful for diagnosing, preventing and/or treating cancers such as leukemia and lymphoma.

Claim 1; SEQ ID NO 140; 199pp; English

The present invention relates to cancer associated sequences (ADQ97025-ADQ98004). The sequences are useful for the diagnosis, prevention and/or treatment of cancer, such as leukemia and lymphoma. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formate directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Sequence 145985 BP; 40325 A; 30740 C; 31191 G; 43391 T; 0 U; 338 Other;

```
useful for screening a candidate agent for its biological effect. (I) is useful in identifying homologous or related genes, in producing compositions that modulate the expression or function of its encoded protein, mapping functional regions of the protein and in studying associated physiological pathways. (I) is also useful for the genetic commonitation of cells, particularly plant cells. (I) is also useful in screening assays of various plant strains to determine the strains that are best capable of withsteading a particular disease or environmental stress. (II) and (III) are useful for screening of biologically active agents, e.g. fungicides, insecticides, etc., for elucidating blochemical pathways. The screened agents are useful in improved methods of treating crops to prevent or treat disease. (II) are also useful in screening of programs to identify agents that mimic or enhance the action of tolerance (factors. Such agents are useful in improved methods of treating crops to programs to identify production of a biosynthetic product in a plant. (III) is useful for identifying other mediators that may induce expression of proteins of interest, for establishing the extent to which any specific insect and/or pathogen is responsable for damage to a particular plant, for identifying other mediators that enhance or induce to environmental stress, for identifying factors involved in construction of the study of genetic function and regulation, or and crimal value and for identifying productions of nutritional, commercial or medicinal value and constrained to the scullular metabolism and for screening compounds that may affect the biological function of the gene or gene products. Note: The sequence data for this parent did not form part of the printed or products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human;

```
The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the
                                                                                                                                                                                                                                                                                     presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

isolated nucleic acid representing a synthetic BAX-gene, useful as

medicament for treating, preventing and/or alleviating yeast or fungal infections or proliferative disorders, or for preventing apoptosis in

or fungal

Claim 36; Fig 2; 344pp; English.

certain diseases

This invention describes a novel nucleic acid representing a synthetic Bax gene. The Bax gene of the invention is useful for identifying Bax-resistant yeast or fungi, identifying, or obtaining and identifying

Candida spp. sequences that are differentially expressed in a pathway eventually leading to programmed cell death or identifying inhibitors or inhibitors sequences of bax-induced cell death. The products of the inhibitor sequences of bax-induced cell death. The products of the invention have cytostatic, fungicide; imminosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The contisense molecules and antibodies useful as medicament or in preparing a medicament for treating, preventing and/or alleviating contisense, or for preventing apoptosis in certain diseases. Such as cancer, or for preventing apoptosis in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preparing a medicament for modifying the endogenic flora of humans and conther mammals. The vaccine is useful for immunisting against yeast or fungal infections. Apoptosis-related diseases include autoimmune disease. This sequence represents a polynucieotide associated with the Bax gene ö Gaps ö DB 6; Length 2091; Sequence 2091 BP; 725 A; 384 C; 430 G; 552 T; 0 U; 0 Other; Indels 6 described in the disclosure of the invention Score 22.6; DE

mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene. Novel polynucleotides derived from Coryneform bacteria, for identifying

Claim 8; SEQ ID NO 1385; 246pp + Sequence Listing; English.

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These rate useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, messuring expression amount and analysing the expression profile or expression pattern of a gene derived from

Corynebacterium glutamicum polynucleotides. The arrays are used to analyse C. glutamicum, particularly for monitoring a fermentation process to determine expression levels of C. glutamicum cellular mRNA. Such monitoring particularly differentiates between expression levels of moliferent strains of C. glutamicum and allows the adjustment of different culture and fermentation conditions. ACA00010-ACA02188 represent C. glutamicum derived polynucleotides described in the disclosure of the
Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office

This invention relates to novel isolated metabolic pathway regulatory polypeptides from Corynebacterium glutamicum, designated MR proteins, and the DNA sequences which encode them. The invention is useful in identification of C glutamicum and related organisms, mapping of genomes of organisms related to C glutamicum, identification and localization of C glutamicum sequences of interest, evolutionary studies, determination of MR protein regions required for function, modulation of MR protein as a fine chemical. The present sequence is that of a gene which encodes a novel isolated metabolic pathway regulatory polypeptide of the invention from Corynebacterium glutamicum. Note: This sequence does not directly from USPTO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           An isolated metabolic pathway regulatory polypeptide from Corynebacterium glutamicum, its portion, or its variant, useful for diagnosing presence

This invention describes novel polymucleotides and polypeptides that are involved in metabolic regulation, i.e. in transcriptional and (post) translational regulation of metabolic proteins in Corynebacterium (glutamicum. Polymucleotides are isolated from a nucleic acid library of c. glutamicum then mutated a specified positions, cloned and expressed by standard methods. Cells, containing vectors that express the polymucleotides are used for production of fine chemicals, preferably amino acids and specifically lyshine, but more generally nucleotides, nucleosides, lipids, fatty acids, diols, carbohydrates, aromatic compounds, vitamins, co-factors and enzymes. These are useful in the companies, optionally as primers and probes, can also be used for identification and classification of c. glutamicum and related species, c.g. for diagnosis, for genomic mapping, functional or evolutionary studies, gene manipulation, and modulation of metabolic activity. Cells that contain the polymucleotides of the invention may produce fine c.g. chemicals in better yields, with higher productivity and/or more
                                                                                                                                                                                                                                                               de; gene; metabolic regulation; fine chemical production; amino acid production; lysine production; nucleotide production; nucleoside production; nucleoside production; lipid production; fatty acid production; carbohydrate production; aromatic compound production; vitamin production; co-factor production; enzyme production; food; animal feed; cosmetic; pharmaceutical.

The present invention provides the protein and coding sequences of the Corynebacterium glutamicum ccpAl gene. The sequences can be used in the production of L form amino acids, particularly L-lysine, which are useful in human medicine, the pharmaceutical and food industries and, particularly, in animal nutrition. The present sequence is the gene of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New ccpAl gene from coryneform bacteria, useful, when suppressed, for
increasing fermentative production of L-amino acids, particularly lysine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a polynucleotide having any of 6006 specific sequences (ABZ5088-ABZ56893), which are expressed by a fungus under specific culture conditions including one or more of eutrophic, oligotrophic, solid, early germination, alkaline, high temperature, low temperature or maltose culture or polynucleotides stringently hybridising progress of fermentation and the growth conditions of a fungus, especially of Aspergillus oryzae which is widely used in industrial fermentation. Also monitoring for fungal contamination. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Acinetobacter baumanii proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial
                                                                                                                                                                                                                                                                    Detection of expression of specific Aspergillus genes for monitoring the fermentation and growth conditions of the fungus, using DNA probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene; Acinetobacter baumannii; bacterial disease; antibacterial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing

c disorder and polymucleotides encoding the polypeptides. The kinase cissor and polymucleotides encoding the polypeptides. The kinase c disorder such as cancer, immune-related diseases, cardiovacular disease, brain or neuronal-associated disease and metabolic disorders, including cancers of tissues, cancers of hematopoietic origin, diseases of the central nervous system, diseases of the peripheral nervous system, diseases of the peripheral nervous system, contral nervous system, diseases of the peripheral nervous system, contral infections, infections caused by prions, alteral sclerosis, viral infections, infections caused by prions, conditions, and order of metabolic disorders, attention disorders, neurological disorders, dyskinesias, hypertension, psychotic disorders, neurological disorders, dyskinesias, concading rhinitis, autoimmunity, atherosclerosis, psoriasis, costecathritis, asthma, chronic inflammatory bowel disease, theumatory pelvic disorders and sistension, costecathritis, asthma, chronic inflammatory bowel disease, clothing disorders and attention as glaucoma, retinopathy and macular describing in disorders and attention as glaucoma, retinopathy and macular describing in gene conlar diseases such as glaucoma, retinopathy and macular describing the configuration, etc. The polymucleotides are useful in gene contar dementia, manic depression, etc. The polymucleotides are useful in gene contar through the children in the above mentioned disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance, herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAH46891-46922 represent human protein kinases encoding cDNA molecules
                                                                                                                                                                                                                                                                                                                                                    Kinase polypeptides useful for treating cancers, Alzheimer's disease, viral infections, diabetes, obesity, organ transplant rejection and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides human protein kinases and protein kinase-like

targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents DNA encoding an A. baumannii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gapa

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme camporate by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for manipulating growth rate in plant or plant growth regulators, for manipulating growth rate in increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, introgen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stream of the capture or plant full length insert content. This sequence represents a plant full length insert of the plant can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                                                                                                                                                                                                                                                                                                          Cao Y;
                                                                                                                                                                                                                                                                                                                                                        Tabaska JE,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Vector: peleloBAC11; Site 1: HindIII; Site 2:
HindIII; The mouse ES library was created by ligating
large-size DNA fragments from RW4 cells into the HindIII
cloning site of the pBeloBAC11 vector. The recombinant
vector was then electroporated into DH10B host cells. The
inserts for the library BAC clone are ~120kb and are
flanked in the vector by T? and Sp6 RNA promoters on
either side of the HindIII cloning site. The library was
constructed by Genome Systems (now Incyte). "

Clones are derived from the bovine BAC library CHORI-240
(http://www.chori.org/bacpac/bovine240.htm). For BAC library
availability, please contact Pieter de Jong (pdejong@mail.cho.org).
Clones may be purchased from BACPAC Resources
(http://www.chori.org/bacpac/ordering information.htm). This work
was undertaken as part of the International Bovine BAC Mapping
Consortium (IBBMC) by CSIRO Livestock Industries, Australia and the
British Columbia Genome Sciences Centre, Canada.
Seq primer: SP6
Class: BAC ends.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

                                                                                                                                                                                                                                                                                                                                                                             (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWAPA2 (gil 4732114 [gb] AR125072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

created by Invitrogen from multiple tissues; Organ: silks, husks, ears, pollen, shoot tips, leaf, root tips, whole seed, embryo. This is a Gateway compatible vector, permitting clone movement to new vector backbones for expression in diverse host cells using recombination rather than restriction enzymes. poly(A)+ mRNA was prepared by Invitrogen, and equimolar amounts of RNA from each of the 12 tissue samples were mixed together for selection of mRNA with a 5' cap. After synthesis of cDNA, a normalization step was conducted against the mixture of RNA sources. Tissues prepared: 1, just emerging silks; 2. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. immature tasseals, srages from 1-2 mm to 1-2 cm; 5. 2 mm to 2 cm ears; 6. pollen; 7. 1 cm vegetative shoot tips from 15 day old seedlings; all leaves with an expanded or partially expanded sheath were removed; 8. mature leaf tissue; 9. 0.5 cm long root tips from 15 day old seedlings; 10. 10 dap whole seed; 11. 12 dap endosperm and embryo; 12. 17 dap endosperm and embryo; 12. 17 dap endosperm and embryo; All of the seedlings; inliversity of Arizona. Clones, high density filters and amplified library can be ordered from the University of Arizona.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

created by Invitrogen from multiple tissues; Organ: silks, husks, ears, pollen, shoot tips, leaf root tips, whole seed, embryo. This is a Gateway compatible vector, permitting clone movement to new vector backbones for expression in diverse host cells using recombination rather than restriction enzymes. poly(A)+ mRNA was prepared by Invitrogen, and equimolar amounts of RNA from each of the 12 tissues samples were mixed together for selection of mRNA with a 5' cap. After synthesis of CDNA, a normalization step was conducted against the mixture of RNA sources. Tissues prepared: 1, just emerging silks; 2. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. inner husks from 15 day old seedlings; 11. 1 can vegetative shoot tips from partially expanded sheath were removed; 8. mature leaf tissue; 9. 0.5 cm long root tips from 15 day old seedlings; 10. 10 dap whole seed; 11. 12 dap endosperm and embryo; 12. 17 dap endosperm and embryo. All of the seedlings; 10. 10 dap whole seed; 11. 12 dap endosperm and ensity filters and amplified library can be ordered from the University of Arizona. Clones, high density filters and amplified library can be ordered from the University of Arizona. (http://www.genome.arizona.edu/orders/)."

Sequence 167503, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENYTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

FILE REPERENCE: CLOOL307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT PILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/231,768

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: PRESENCE OF WINDOWS Version 4.0

SEQ ID NO 167503

LENGTH: 601
